

**Revival of Technology as Master of Science: Let us do Technology, accordingly
Political Science cannot be the Master of all Science**

Agenagn Kebede
Assistant Professor of Political Science at Woldia University,
Editor, Blogger Reviewer, SYRFM, and Mentor at Publon Academy
Woldia City, Ethiopia

Dear all,

When I was in a philosophy class of undergraduates, I learned one thing in Political Philosophy. That thing is taken as the political theory of ancient Greece philosopher, Aristotle. Aristotle said that Political Science is the master of all science since all issues of development, institution and innovation are decided by political scientists and politicians; however, in this twenty-first century, Aristotle's count of Political Science as master of all has been falsified. The decision, the influence, and the diversion are not coming from Political Science but from Technology, even Political Science itself survives because of technology. Karl Marx would not have had the idea of socialism, if technology could not take hand in the industrial revolution and caused millions to be unemployed. Smith would have never discussed capitalism, if technology could not cause surplus value in a very short period. Lesbians and gays would not have had the political idea of human cloning and would have never loved their new identity if technology did not allow them to get birth within either X_X or Y-Y sexual intercourse.

The cyber-attack and arming nuclear weapons are the upshot of technology that shape, balance, and influence global politics. North Korea and the United States of America never flock to war since both of them reach in technology. China is influencing African politics owing to its technological advancement. Since the 1960s, the small state, Israel has come as a great state because of the technological development of Mosad. The World has experienced the electronic vote during an election; however the political analysts cannot guess who is the next president in country "X" after the electronic vote, thereupon the hackers can change the voter voice in one click of the computer. Look how the hackers influence political scientists. In a narrow sense, politics means discussion on issues. Is this possible via Zoom, Telegram, Skype, Facebook, and so on? Yep. That means technology is a means for making political discourse, too.

Dear editors, it is a perfect time to launch such kind of journal which focuses on technology. This twenty-first century is a time for technology. It is a technology that can lead the world community but not political scientists and politicians. War, peace, life-interaction, freedom, and democracy will get their bedrock from technology. Capitalists, liberalists, even socialists will focus on ground theory to find a new idea that fits this time technology. Go ahead, let me stand with you for the development of our journal. To focus on technology means to focus on the source of everything.

With regards,
